

$H\alpha$ spectroscopy of close-in planets

Sebastian Kohl

Tigre Workshop 2016

1 Introduction and Previous Work

2 Telluric Contamination

3 Observations with TIGRE

Outline of the problem

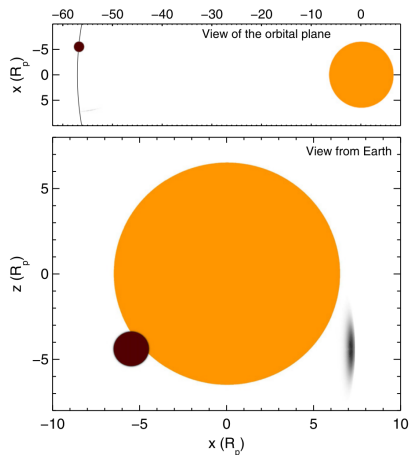

Figure: To-scale projections of the planet and bow shock. Cauley 2015

How to measure it?

Figure: Spectrum of 55 Cnc.

Imprint on Spectra

Figure: Absorption as a function of time for a single transit. Cauley 2015

Can TIGRE really do that?

- faintest object: $m_V=8.54$
- we have to detect an absorption excess of 1%
- in $H\alpha$ line core we get $S/N=50$ per pixel for $t_{exp}=20$ min.
- > 36 pixels cover $H\alpha$ line core
- $\Rightarrow S/N \approx 300$
- $\Rightarrow 1\%$ corresponds to 3σ signal

Target Selection

Figure: Hydrogen comet tail behind GJ 436b. Ehrenreich 2015

Target Selection

Figure: Lightcurve of 55 Cnc b in different spectral ranges. Ehrenreich 2012

Telluric Contamination

Figure: Telluric absorption bands in the visible wavelength range. Smette 2015

Telluric Contamination
