

Introduction to General Relativity and its *astrophysical applications*

Robi Banerjee
Hamburger Sternwarte
banerjee@hs.uni-hamburg.de

General Informations

Outline / Topics

This is an introductory course to the theory of *General Relativity* where we will focus on the **physics** basics.

The concepts of GR will than be applied to astrophysical phenomena.

Lecture is based on **James Hartle's book:** *GRAVITY: An introduction to Einstein's General Relativity*, Addison Wesley, 2003

Outline of the **physical basics** & mathematics :

- Newton's physics of gravity
- Curvilinear space
- Geometry as physics (and vice versa)
- Concepts of *Special Relativity* / SPACETIME
- The Equivalence Principle
- Curved SPACETIME
- Geodesics
- Differential Geometry (a pragmatic summary)
- Einstein's field equations

General Informations

Outline / Topics

Astrophysical applications:

- Solar system
- Black holes
- Kerr black holes
- Accretion discs
- Gravitational lensing
- Gravitational waves
- Cosmology in a nut shell
- ...
